AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

PHASE 8

PROJECT DEMONSTRATION PHASE

1. Introduction

The Project Demonstration Phase presents the working model of the Auto Ticket Classification using Flow Designer system. The demonstration explains how a ticket enters the workflow, how the system validates and classifies it, and how the classified ticket is routed and updated.

This phase provides a practical view of the system developed during the earlier design, planning, implementation, and documentation phases.

2. Demonstration Objectives

- Demonstrate the complete ticket classification workflow.
- Show how a ticket is submitted and processed.
- Explain the classification conditions and workflow decisions.
- Demonstrate ticket routing and status updates.
- Verify that the system produces the expected output.
- Provide a clear presentation of the project to users, faculty, or evaluators.

3. Demonstration Environment

The demonstration is performed using the configured Flow Designer environment and the required ticket data. The environment should contain the workflow, classification rules, actions, data source, and permissions required to execute the project.

3.1 Required Setup

- Configured Flow Designer workflow.
- Available ticket data or ticket creation interface.
- Configured classification conditions.
- Required assignment groups or routing destinations.
- Notification and status update configuration, where applicable.
- Stable network connection when the platform is cloud based.

4. System Demonstration Overview

The demonstration follows the same sequence as the operational workflow. A sample ticket is created or received, validated, classified, routed, updated, and completed. Each stage is shown to explain how the automation reduces manual ticket handling.

4.1 Demonstration Sequence

- Open the ticket or input interface.
- Create or select a sample ticket.
- Enter the required ticket details.
- Submit or trigger the workflow.
- Observe validation and classification.

- Verify the assigned category.
- Verify routing and status updates.
- Check notifications or workflow history.
- Review the final ticket result.

5. Ticket Creation Demonstration

A sample support ticket is created with realistic information. The subject and description are selected so that they match one of the configured classification conditions. Required fields are completed before the ticket is submitted.

5.1 Sample Ticket

- Ticket ID: TKT-001
- Subject: Unable to access application account
- Description: User is unable to access the required application.
- Priority: Medium
- Requester: Sample User

6. Input Validation Demonstration

After the ticket is submitted, the workflow checks the required information. The system verifies that the ticket contains sufficient data for classification. If the required fields are present, the workflow continues to the classification stage.

6.1 Validation Checks

- Ticket identifier is available.
- Subject is available.
- Description is available.
- Required requester information is available.
- Input values are suitable for processing.

7. Classification Demonstration

The classification stage evaluates the ticket information against the configured rules. In the sample demonstration, the ticket description indicates an application access issue, so the matching classification condition is selected.

7.1 Classification Steps

- Read ticket subject and description.
- Evaluate configured conditions.
- Identify the matching category.
- Assign the category to the ticket.
- Continue to the routing stage.

8. Routing Demonstration

After classification, the ticket is directed to the appropriate support group or workflow path. The routing action is based on the category assigned during classification.

8.1 Routing Verification

- Confirm the selected category.
- Confirm the destination or assignment group.

- Confirm that the ticket reaches the expected workflow path.
- Confirm that the ticket status is updated when required.

9. Notification Demonstration

If notifications are configured, the demonstration shows how the responsible user or group is informed after classification or assignment. Notification content should provide enough information to identify the ticket and required action.

9.1 Notification Checks

- Notification trigger is activated.
- Correct recipient or group is selected.
- Ticket reference is included.
- Notification status is verified.

10. Complete Workflow Demonstration

The complete demonstration can be represented as: Ticket Input → Validation → Classification → Routing → Status Update → Notification → Completion.

Figure 1: Complete Demonstration Workflow

Ticket Input → Validation → Classification → Routing → Status Update → Notification → Completion.

Figure 1. Complete Demonstration Workflow

11. Sample Demonstration Scenarios

11.1 Scenario 1 – Application Issue

- Input: Ticket describing an application problem.
- Expected classification: Application-related category.
- Expected action: Route to the application support group.

11.2 Scenario 2 – Access Issue

- Input: Ticket describing account or access difficulty.
- Expected classification: Access-related category.
- Expected action: Route to the appropriate access support group.

11.3 Scenario 3 – Unknown Issue

- Input: Ticket that does not match a configured classification rule.
- Expected classification: Default or exception category.
- Expected action: Route for manual review.

12. Exception Handling Demonstration

The demonstration also covers situations in which the normal workflow cannot continue. Missing information, unsupported ticket types, or failed actions can be directed to an exception path.

- Missing required information.
- No matching classification rule.
- Invalid ticket values.
- Workflow action failure.
- Notification or routing failure.

13. User Interaction Demonstration

The demonstration shows how a user interacts with the system from ticket submission through final classification. The user does not need to manually perform every routing decision because the configured workflow performs these actions automatically.

- Enter ticket information.
- Submit the ticket.
- Wait for workflow processing.
- Review the classification result.
- Review assignment and status.
- Take further action if manual intervention is required.

14. Results Demonstration

The demonstration verifies that the system produces the expected classification and routing result for the selected test cases. Successful execution indicates that the configured flow can process tickets according to the defined rules.

14.1 Expected Results

- Ticket is accepted successfully.
- Required data is validated.
- Correct classification rule is selected.
- Category is assigned.
- Ticket is routed correctly.
- Status is updated.
- Required notification is generated.

15. Demonstration Test Cases

15.1 Test Case 1 – Valid Ticket

- Input: Complete ticket with a recognized category.
- Expected Result: Correct classification and routing.
- Status: Pass when the expected workflow is completed.

15.2 Test Case 2 – Missing Information

- Input: Ticket missing a required field.
- Expected Result: Validation identifies the issue.
- Status: Pass when the exception path works correctly.

15.3 Test Case 3 – No Matching Rule

- Input: Ticket that does not match available conditions.
- Expected Result: Default or manual-review path is selected.
- Status: Pass when the ticket is handled safely.

16. Performance Observation

During demonstration, the workflow execution time, successful completion of actions, and consistency of classification can be observed. The system should process normal tickets without unnecessary manual intervention.

- Observe workflow execution.

- Check action completion.
- Verify classification consistency.
- Observe routing response.
- Record any errors or delays.

17. Security Demonstration

The demonstration should use authorized access to the Flow Designer environment and ticket data. Only permitted users should be able to modify workflows, classification rules, or sensitive ticket information.

18. Troubleshooting During Demonstration

If an expected result is not obtained, the workflow execution history and configured conditions should be reviewed.

- Check whether the workflow was triggered.
- Verify input data.
- Review classification conditions.
- Check action configuration.
- Verify routing destination.
- Review notification settings.
- Check execution logs or error messages.

19. Demonstration Presentation Flow

A project presentation can follow this order:

- Introduce the project and its objective.
- Explain the problem being addressed.
- Show the workflow design.
- Create or open a sample ticket.
- Demonstrate validation.
- Demonstrate classification.
- Demonstrate routing and status update.
- Show the final result.
- Explain testing and future enhancements.

20. Advantages Demonstrated

- Reduces repetitive manual ticket classification.
- Provides consistent rule-based processing.
- Improves ticket routing efficiency.
- Provides a structured workflow.
- Supports easier monitoring and tracking.
- Can be extended with additional classification rules.

21. Limitations Demonstrated

- Classification depends on the configured rules.
- Poor or incomplete ticket information can affect results.
- New ticket types may require new conditions.

- Platform or configuration changes may require workflow updates.

22. Future Enhancements

- Introduce more advanced automated classification.
- Add analytics and dashboard features.
- Improve handling of ambiguous tickets.
- Add more ticket sources and integrations.
- Provide enhanced notifications and monitoring.
- Support continuous improvement of classification rules.

23. Conclusion

The Project Demonstration Phase shows the practical operation of the Auto Ticket Classification using Flow Designer system. The demonstration covers ticket creation, validation, classification, routing, notification, exception handling, and final results. It confirms how the configured workflow can automate ticket processing and provides a clear presentation of the completed project.
