AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

PHASE 5 – PROJECT DEVELOPMENT PHASE

Introduction

In modern organizations, a large number of support requests are received through ticketing systems. Manually reviewing, categorizing, and assigning every ticket can take considerable time and may lead to delays or inconsistent routing. Automation can help streamline this process by identifying the appropriate category and directing the ticket to the responsible team.

The project **Auto Ticket Classification using FLOW DESIGNER** focuses on developing an automated workflow for classifying incoming support tickets. The workflow uses the information available in a ticket and applies configured logic to determine its category. After classification, the ticket can be routed or assigned to the appropriate group or queue.

Project Purpose

The main purpose of this project is to reduce manual effort in ticket management and create a structured process for handling incoming requests. By automating repetitive classification and routing activities, the system can support faster and more consistent ticket processing.

Role of FLOW DESIGNER

FLOW DESIGNER provides the environment for creating and managing the workflow used in this project. It allows different actions and conditions to be arranged into a logical process. The workflow can receive ticket information, evaluate conditions, determine the required classification, and perform subsequent actions such as assignment or routing.

Project Development Phase

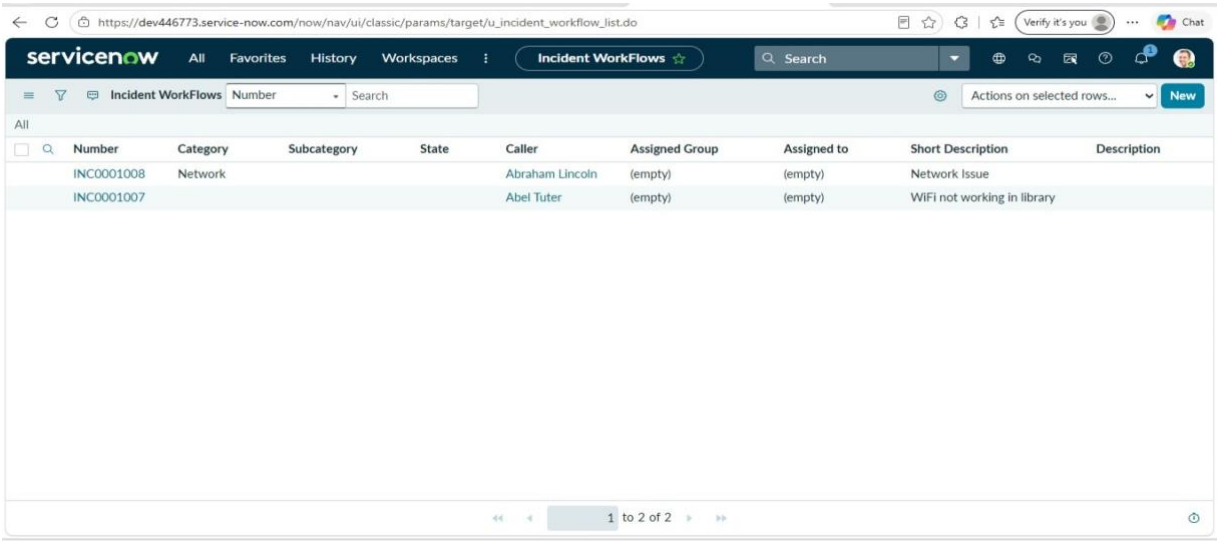

Phase 5 concentrates on the development of the proposed solution. During this phase, the workflow structure is created, classification logic is configured, required actions are connected, and the overall process is prepared for testing. The development work provides the foundation for the testing and validation activities carried out in the next phase.

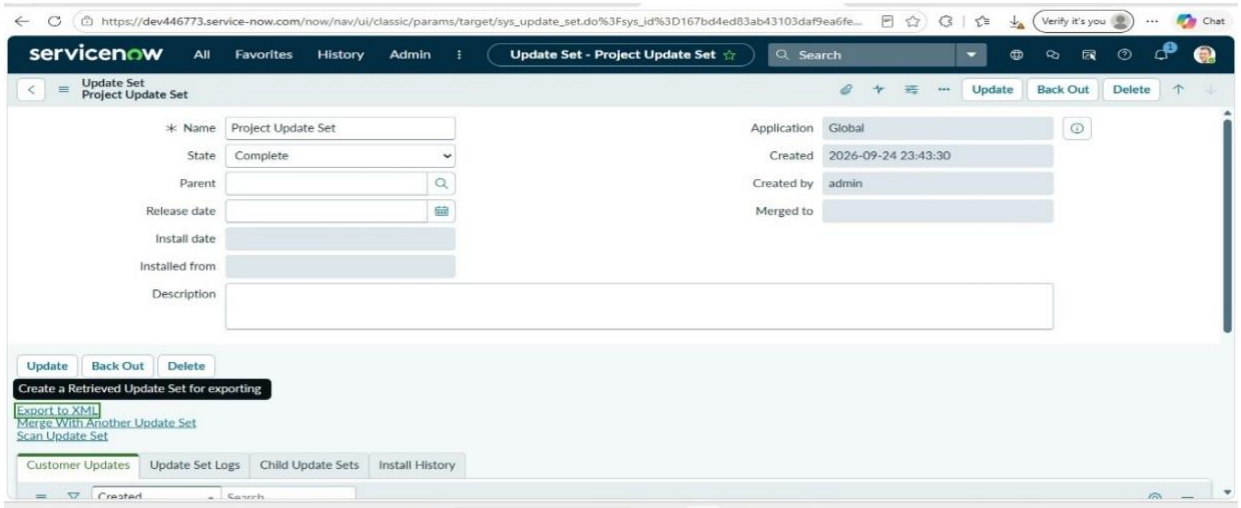

Objectives

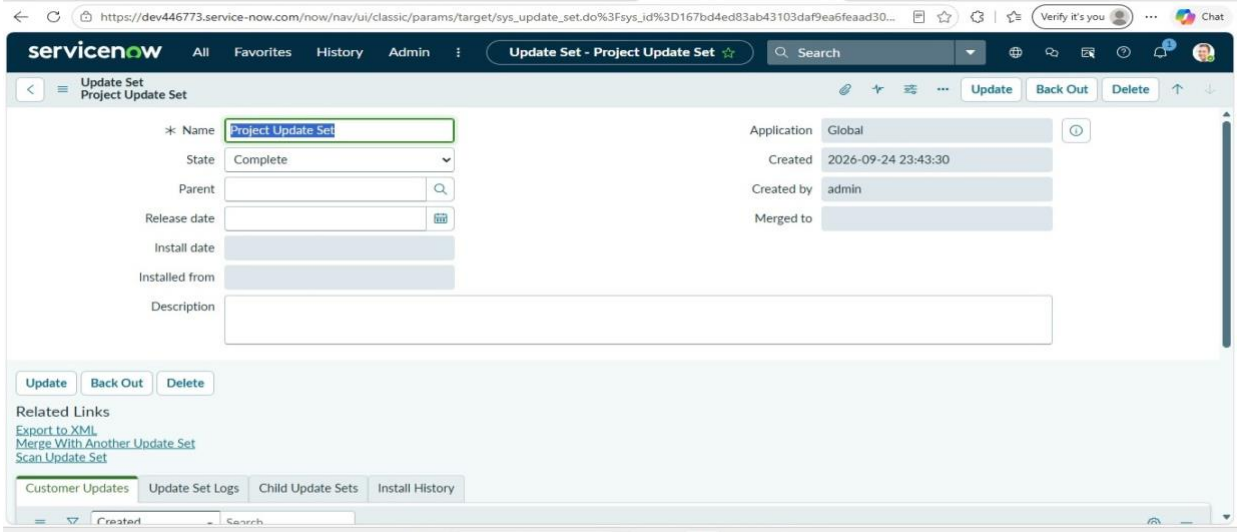

- Develop an automated ticket classification workflow.
- Configure suitable conditions for identifying ticket categories.
- Automate the routing or assignment of classified tickets.
- Reduce repetitive manual ticket-handling activities.
- Create a workflow that can be tested and improved in later phases.

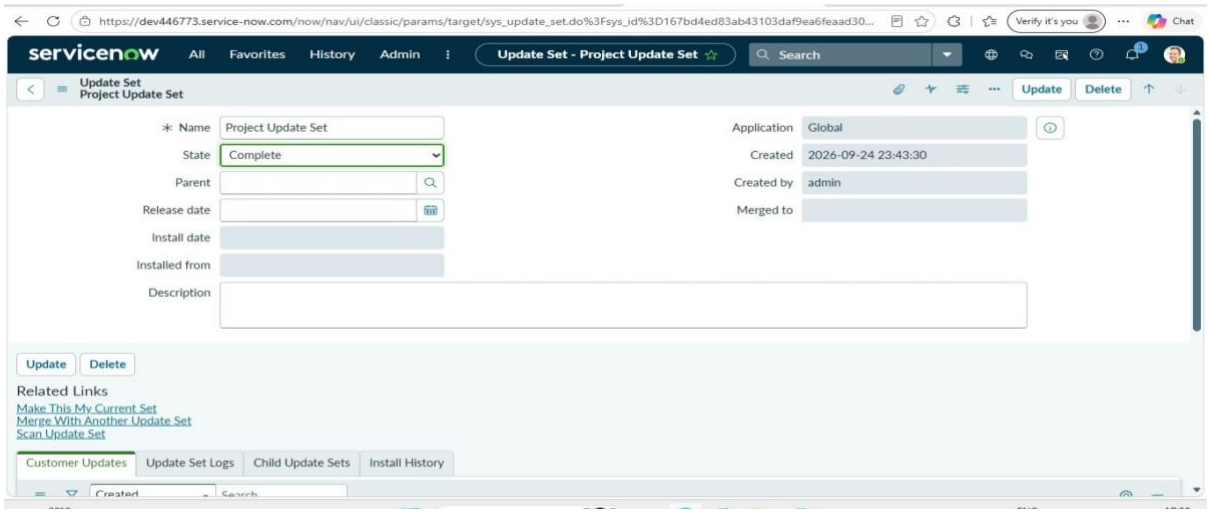

Expected Benefit

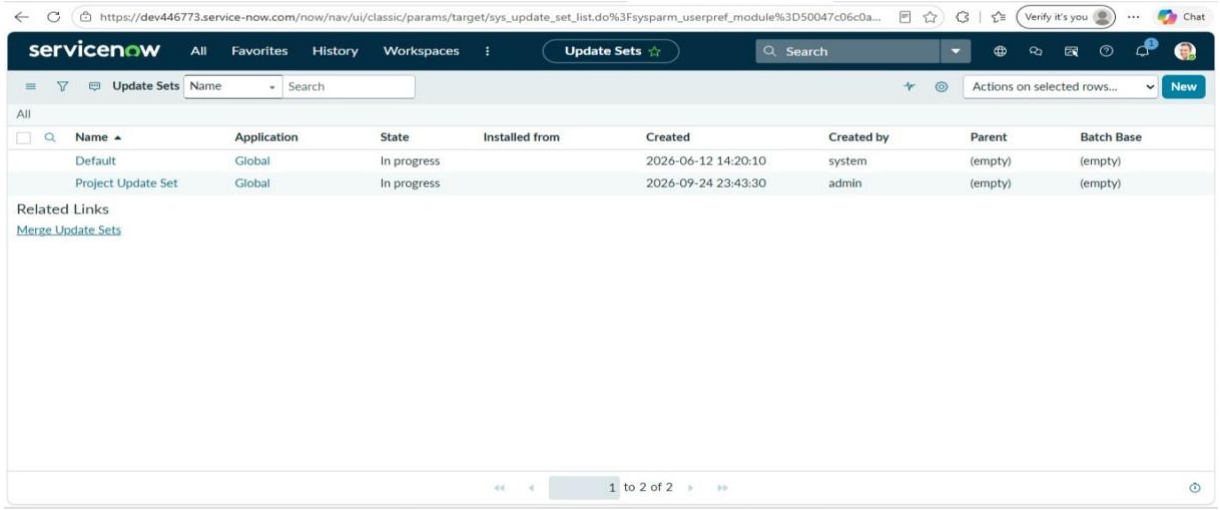

The developed solution is expected to provide a more organized approach to ticket classification and routing. It can help reduce manual workload, improve consistency, and establish a clear workflow for handling support requests.

Conclusion

The Auto Ticket Classification using FLOW DESIGNER project introduces an automated approach to managing support tickets. Phase 5 focuses on developing the workflow and configuring the classification and routing process. The completed development provides the basis for systematic testing and validation in the following project phase.
